Buildings account for almost half of total primary energy use and related greenhouse emissions worldwide. Although current energy systems are improving, they still fall disappointingly short of meeting acceptable limits for efficiency. Well-trained energy auditors

The energy audit in a building is a
feasibility study. For it not only serves

to identify energy use among the various services and to identify opportunities for energy conservation, but it is also a crucial first step in establishing an energy management programme. The audit will produce the data on which such a programme is based.

To perform an energy audit, several tasks are typically carried out depending on the type of the audit and the size and function of the building. Some of the tasks may have to be

repeated, reduced in scope, or even eliminated based on the findings of other tasks. Therefore, the execution of an energy audit is often not a linear process and is rather iterative.

8.2 The building as an energy system
Modern buildings are complex structures; there are significant interactions among the various systems of which they are comprised. The energy auditor needs to look holistically at the building when

An energy audit inspects a building or home's energy usage to help identify the factors that drive up energy consumption. Information gathered through the inspection is used as a basis for presented recommendations to cut down energy costs.
