Computing education is in enormous demand. Many students (both children and adult) are realizing that they will need programming in the future. This book presents the argument that they are not all going to use programming in the same way and for the same purposes. What do we mean when we talk about teaching everyone to program? When we target a broad audience, should we have the same goals as computer science education for professional software developers? How do we design computing education that works for everyone? This book proposes use

of a learner-centered design approach to create computing education for a broad audience. It considers several reasons for teaching computing to everyone and how the different reasons lead to different choices about learning goals and teaching methods. The book reviews the history of the idea that programming isn't just for the professional software developer. It uses research studies on teaching computing in liberal arts programs, to graphic designers, to high school teachers, in order to explore the idea that computer science for everyone requires us to re-think how we teach and what we teach. The conclusion describes how we might create computing education for everyone.

This is both a first and a second level course in Pascal. It starts at an elementary

level and works up to a point where problems of realistic complexity can be tackled. It is aimed at two audiences: on the one hand the computer professional who has a good knowledge of Cobol or Fortran but needs convincing that Pascal is worth learning, and on the other hand the amateur computer enthusiast who may have a smattering of Basic or may be an absolute beginner. Its approach is based on two principles that are not always widely recognized. The first is that computing is no longer a specialist subject. In the early days of computing a priesthood arose whose function was to minister to those awesome, and awesomely expensive, machines. Just as in the ancient world, when illiteracy was rife, the scribes formed a priestly caste with special status, so the programmers of yesteryear were regarded with reverence. But times are changing: mass computer literacy is on its way. We find already that when a computer enters a classroom it is not long before the pupils are explaining the finer points of its use to their teacher - for children seem to have greater programming aptitude than adults. This book, it is hoped, is part of that process of education by which the computer is brought down to earth; and therefore it attempts to divest computing of the mystique (and deliberate mystification) that still tends to surround the subject.
